Lithium firms race for new source

All along the world’s EV supply chains, lithium is being courted as the solution to the ever-slowing resources. While protecting the environment makes the drive electric more appealing, the exploding car market is showing its impact on the availability of lithium. But the investment and industry experts are marveling at the rate of uptake and development; those technological opportunities are in a push and pull of demand and supply. This year, global electric vehicles (EV) market growth projections for 2023 are at 70 million units, and the BEV market alone will grow by 15 million units. By 2024, the world will see more than 50 million BEV sales. This will require a new source of lithium. The lithium industry is racing to find new sources of supply. This is a complex and capital-intensive project, and projects such as the Chilean and Australian lithium deposits are expected to be the primary source. But the industry needs to explore other sources as well. Some experts believe that China will be a major player in the lithium market. The country is already the world’s largest producer of lithium carbonate. The government has also been investing heavily in research and development to develop new sources of supply. This is a major challenge for the industry. The world needs to find new sources of lithium to meet the growing demand for EVs. And this is why the lithium industry is racing to find new sources of supply. The world needs to find new sources of supply.
